1. The data of the class, the variable radius and all the methods.
2. The name of the constructor of a class must share the name of the class.
3. Private makes the variable only accessible inside the scope of the class/object it's inside. Public makes the variable accessible from anywhere.
4. Invalid, any modifications must be made through the usage of an instance method to follow the principles of Object Oriented Programming.
5.
    a. Roo
    b. x
    c. getX
    d. setX
    e. There is no helper methods
    f. Roo
    g. 5 including the constructor.
6. The class is what provides the variables and methods for the object. The object is an "instance" of the class which can exist as a separate entity.

9.
    a. z
    b. x and y
    c. y
    d. y and z

11. Overriding and Overloading are both methods that share the name of another method used by the class/instance. The distinction is the scope, overriding methods override methods coming from the superclass of an instance while overloading methods override methods of the same scope as the class/instance.
