Assignment Name:

Understanding the Problem:

1. How did you approach understanding the challenge?

   I understood the problem as creating multiple bowlers (objects) and making them take turns with 2 throws each. The bowler themselves will handle changing their stats and handling bowling by randomly generating the amount of pins the knock over. I print their result every throw and allow the user to pause at any given point.

2. Were there any parts of the problem that you found confusing at first? If so, how did you resolve the confusion?
   None

Planning the Solution:

1. Did you create a plan or break the problem into smaller steps before coding?
   I broke the problem into smaller steps. I started with the class, creating their values, implementing a constructor with an argument for name,adding a method to roll their pins, updating their stats based on pins knocked and their current throw, and creating output methods that either print or return stats. The main method creates multiple bowlers with different names and makes them take turns with two throws each turn. It then pauses based on the user's input and outputs the total stats at the very end.

2. How did you decide on which tools, algorithms, and data structures to use?
   I decided to use an object since it's part of the assignment and it seems to be the most efficient method to create the project. Besides that, I had to borrow the field type from java's util library to loop through all of the variables that the object stores.

Implementation:

1. Did you write the code in smaller pieces or attempt the entire solution at once?
   I attempted the entire solution at once.

2. How did you test your solution to ensure that it was working correctly?
   I used chatGpt and manually verified the accumulation of pins and score.

Overcoming Challenges:

1. What part of the problem was the most difficult for you?
   The hardest part was separating what methods did what, I needed the main method to be able to access the stats before they're updated for the next throw which caused me to redo part of the code and rethink the process.

2. How did you handle moments where you felt stuck or unsure what to do next?
   I searched online for possible solutions.

Learning:

1. Was there anything that you learned that you think will help you with future challenges?
   I have to consider all details of the process before starting the code to prevent wasting time and effort.
