2. The method declaration contains the method access level, return type, whether it's a class method, the name, and its parameters. The method's body is what contains statements of the method.
3. Visibility modifiers.
4. Visibility.
5. Main Method: var1 and var2. Method1: var3 and var4.
6.
    a. public static int getVowels(String string)
    b. public static int extractDigit(Int int)
    c. public static String insertString(String string, Integer int)
7.
    a. Interpreters can distinguish between methods by using their characteristics like their types, order, and the amount of parameters.
    b. Yes they can have the same name, as long as their characteristics can distinguish themselves from each other.
8.
    a. The return statement is used to send a value back to the method call
    b. A return statement can only return one value.
    c. A method returning a value would specify its type in its method declaration. A method that does not return a value would have "void" in its return type declaration to specify it does not return anything.
9. The program has a superfluous method call that doesnt do anything. Only the method call used in the variable declaration is necessary.
11.
    a. True
    b. False, the method call can be used by itself and does not have to be used in an assignment statement.
    c. False, the void keyword in a method declaration specifies that the method does not return a value.
    d. False, the access modifier affects the access level of the method, not the return type.
    e. True
    f. False, the curly braces are not necessary.
    g. False, a local variable only pertains to the method it is inside.
    h. True, however the change only occurs inside the method.
    i. False, method overloading means utilizing the same method name with different parameters.
    j. True
    k. False, it contains more than the data types but the assumptions for the values themselves.
    l. False, the postcondition only specifies what the method outputs.
