Assignment Name:

Understanding the Problem:

1. How did you approach understanding the challenge?

The assignment involves creating an algorithm that loops through all possible combinations of A and B to see if they form a pythagorean triple in which all values are integers. We can solve this by checking whether the sum of A squared and B squared (C squared) is integer in its square root form.

2. Were there any parts of the problem that you found confusing at first? If so, how did you resolve the confusion?

I was confused about the semantics of the problem. It states A and B which I interpreted as the squared form of their respective letter values (a and b). To make sure I was reading the problem correctly, I directly asked the teacher.

Planning the Solution:

1. Did you create a plan or break the problem into smaller steps before coding?
    a. Create a loop that loops through all combinations of A and B
    b. Check if the square root of the sum of A^2 and B^2 is an integer.
    c. Output the values of A, B, and C if C is an integer.

2. How did you decide on which tools, algorithms, and data structures to use?
    a. I used methods since the exercise specifically demands that I use one.

Implementation:

1. Did you write the code in smaller pieces or attempt the entire solution at once?
   Attempted the entire solution at once

2. How did you test your solution to ensure that it was working correctly?
   I verified the output of the program with ChatGPT.

Overcoming Challenges:

1. What part of the problem was the most difficult for you?

The hardest part was implementing the loops to search for each combination.
There are many ways to approach this but I wanted to choose one which did not involve duplicates.

2. How did you handle moments where you felt stuck or unsure what to do next?

   There weren't any moments.

Learning:

1. Was there anything that you learned that you think will help you with future challenges?

I learned a way to perform an algorithm that did not return any duplicate pairings.
